Data Frames

Data frames are used to store tabular data

- They are represented as a special type of list where every element of the list has to have the same length
- Each element of the list can be thought of as a column and the length of each element of the list is the number of rows
- Unlike matrices, data frames can store different classes of objects in each column (just like lists);
 matrices must have every element be the same class
- Data frames also have a special attribute called row.names
- Data frames are usually created by calling read.table() or read.csv()
- Can be converted to a matrix by calling data.matrix()

Data Frames

```
> x <- data.frame(foo = 1:4, bar = c(T, T, F, F))
> x
    foo bar
1    1    TRUE
2    2    TRUE
3    3    FALSE
4    4   FALSE
> nrow(x)
[1]    4
> ncol(x)
[1]    2
```
